Semiconductor p-n junctions and superconductor normal metal s-n junctions are equivalent.

Led – photodiode:

S – N junction:

$$I_M = V_E$$

$$V_M = I_E$$

I_E -- Electric current; V_E -- Electric voltage; I_M -- Magnetic current;
 V_M -- Magnetic voltage.

S – N junction oscillation frequency:

$$f = \frac{V_E}{q_m} = 4.836 \times 10^{14} \text{ Hz} \quad (V_E = 1V)$$

LED oscillation frequency:

$$f = \frac{I_E}{q_e} \frac{\alpha}{2}; \quad \alpha \text{ -- Fine structure constant.}$$

$$I_E = 20mA \quad \Leftrightarrow \quad f = 4.836 \times 10^{14} \text{ Hz}$$

q_m -- Magnetic charge quantum; q_e -- Electric charge quantum.

Photodiode voltage:

$$V_E = \frac{k_B T}{q_e} = 25.84mV ; \quad T = 300 \text{ K}$$

S-N junction current:

$$I_E = \frac{k_B T}{q_m} = 2\mu A$$

Semiconductor junctions and Josephson single junctions all oscillate and all generate electricity.

Semiconductor junctions detect photons and superconductor normal metal junctions detect neutrinos.

k_B -- Boltzmann constant; T – Temperature.

S-N junctions also generate light.

The nature explores all the possibilities.

We are the nature doing that.

All that man do is natural, not artificial.
